

MPT Product Development Database

Inclusion Criteria & Information Update Methodology

The MPT Product Development Database includes MPT products that are in active development. The database outlines detailed product information and can be searched to display products by desired criteria as selected from the drop-down boxes. Click on the product name to access detailed information on each product.

Inclusion Criteria

Product Classification

For a product to be classified as an MPT, the MPT Product Development Database requires that it demonstrate, through preclinical or clinical studies, successful positive test results for two or more of the following indications: unintended pregnancy, HIV and/or other sexually transmitted infection (STI). Additionally, for a product to be included in the database, it must have current funding and be in active development and/or the developer must be actively presenting findings from recently completed studies. There are other MPT candidates not listed that may move forward pending funding, at which time they would be reflected in the database.

Development Stages

MPT candidates in Preclinical (Pre1-2) and Clinical (C1-C4) stages of product development are required to meet one or more of the following criteria:

- 1) GMP manufactured drug or device
- 2) Initiation of IND enabling preclinical GLP toxicology studies program
- 3) In vivo animal model data supporting an MPT target indication

For an MPT product in development with more than one indication, the listed Stage of Development will be based on the earliest stage of development for an individual indication listed for that product. For example, a product in a phase 3 efficacy trial for contraception and in preclinical development for STI prevention would be categorized as preclinical as an MPT. More detailed information on the development stage for each product and each indication is listed in the detailed product profile, which can be accessed by clicking on the product name.

MPT Product Development Database

Inclusion Criteria & Information Update Methodology

Database Update Methodology

The MPT Product Development Database undergoes an annual update using resources vetted for this purpose, including:

- 1) Publically available search mechanisms for MPT relevant funding provided by foundations and government agencies,
- 2) Information from product developers and other relevant stakeholders,
- 3) Review of published peer-reviewed literature,
- 4) Review of published materials from relevant scientific conferences and stakeholder meetings,
- 5) Information provided by the IMPT and Network of Experts (NoE) members about latest scientific developments in the areas of contraception and HIV prevention, and
- 6) Review of relevant online resources.

After each round of fielding new data and preparing updated information for the MPT database, the database revisions are reviewed and vetted by MPT funders and other technical partners. To this end, the online database includes a feedback form for users to report on missing and/or incorrect information in the database.

In addition, CAMI Health staff are in regular contact with developer stakeholders and collect and incorporate any feedback they have related to their products on an ongoing basis in an effort to ensure the information included in the database remains as up to date as possible.

If you know of an MPT product not included in the database or have updated information for listed products, please complete the MPT Database Feedback form or contact us at cami@cam-health.org.
